Eudemonistic Light

In presenting the work of Thomas Aquinas, Roberta De Monticelli writes: "Thomas Aquinas' ethic is eudemonistic, that is it is an ethic of happiness [...]. Naturally in the ancient eudemonistic tradition, life was not simply the pleasant life or a generically psychological condition: a happy life was a successful life, a full life, a life fulfilled in all its potentials, it was managing to actually be what we could be. In this sense, a thing can also be happy when it is successful: the criterion is that a happy or successful thing provides happiness to others, in some way it is a source of enjoyment for everyone". Let's try reread

the passage by replacing the word "thing" with the word "light"; the result is the underlying belief that iGuzzini Illuminazione applies to lighting design and the systems that deliver it. The quality of light influences the quality of life and it is clear that light must combine technique and emotions contemporaneously, defining new sceneries, values, meanings, feelings, culture, comfort and pathos, overcoming the simple light/dark dichotomy. Furthermore, it must achieve this in compliance with the environment and available resources. As we are all aware, iGuzzini Illuminazione included, saving energy is achieved not only

by reducing the number of fittings, but also through correct planning on the part of the lighting designer. Light has a communicative and social value in its ability to optimise urban spaces, giving the possibility of reclaiming the culture of a place, encourage aggregation, stimulating business and tourism, making events and architecture spectacular and increasing the feeling of safety. There is a theme that connects Richard Sennet's Flexible man, Corrado Poli's Flexible cities and iGuzzini Illuminazione's flexible light; and it is the actual condition of flexibility, a quality that recalls a willingness to change, being able

to adapt to changing situations without falling apart (Sennet, starting from this consideration, even wrote, like Adam Smith before him, that flexibility is an entrepreneurial virtue: "It may seem strange that Italy could be an example of state of the art production innovation"). And I like to think of a natural image that recalls the concept of flexibility, a tree's ability to bend with the power of the wind, following the changes in intensity and direction. A wholly sustainable value. And what if "flexibility" was one of the new "Memos for the Millennium"? For iGuzzini Illuminazione it already is.

Museum LED Lighting

Palco

Just like traditional bulbs which are not all the same (some emit warmer light, others cooler tones), LEDs can be separated into those that emit luminous flux in different shades of white (cool, for example, for the typical use in street lights). But there are also differences in colour rendering quality. Some have an extremely high colour quality and are particularly suitable for museums and galleries, where the balance of nuances cannot be even slightly altered in order to preserve the correct perception and enjoyment of works of art. Until recently, the lamps that most accurately rendered painter's colours were considered to be halogens,

Primopiano Professional

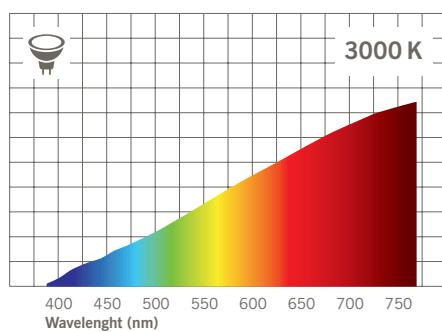

particularly the dichroic type. Now, technology has also made available LEDs. The new-generation combine efficiency with low energy consumption and great light spectrum quality. Obviously, this quality becomes a precious ally for exhibition curators, who can use light to control the perceptions of the public with respect to the works of art, essential, for example, for what is referred to as the 'luminous climate'. The lighting of fabrics, and therefore fashion, deserves its own mention. New LEDs have a very high level of colour rendering, identified by an extremely high CRI (colour rendering index). The higher

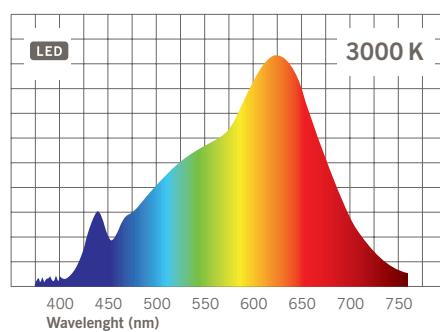

Primopiano Wall Washer

the colour rendering index (up to a maximum of 100), the more balanced the lamp is. This enhancement of the value of colour is also achieved through the choice of colour temperature, expressed in degrees Kelvin, depending on the shades for saturation: from 3000K for warm colours to 6000K for cooler ones. If we consider light distribution in a room, LED lamps can also be mounted in wall-washer luminaires for uniform lighting of the walls, a handy device for being able to freely position works of art on the vertical surfaces, deciding whether or not to leave the higher sections of the walls in the shadow.

Emission spectrum of halogen lamp.

LED emission spectrum of the high Colour rendering index.

Museum, artist, spectator, light. A museum is not only the space in which works of art are exhibited, but also the environment where the artist and spectator meet. Its job is to create clean and neutral backgrounds to focus the attention of the spectator on the work itself. But what happens when the context changes? The space can take part in the dialogue between the spectator and the exhibition. The artist communicates his ideas creatively, presenting a subjective reality in order to achieve authentic emotions and feelings, with the

aim of creating a dynamic communication between imagination, fantasy and spectator. He gives the work meaning and value. His role is defined by the will of the author and by the design of the space. But the subject that perceives the work may not fit the role that the author had imagined for him; he can move to an active participation, to the point of becoming an integral part of the work itself. And finally light, the essential element that influences the communication

between work and spectator. It is through light that the feelings, emotions and even the meaning that the artist wanted to transmit can be emphasized.

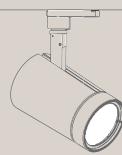

Palco, a veritable family of projectors, considers the work exhibited not only as a physical element, but also its content, the feelings and the message that it is communicating, without forgetting about the space and its contribution to the work.

Its shape is inspired by the brush, the main tool used by the artist in the creative process.

Primopiano

led / energy saving / precision
enhancement / professional
colour rendering / uniformity
museum / exhibition

Lighting works of art requires high-performance fittings that can rigorously respect the quality of the colours, surfaces and volumes. This is why the range of Primopiano projectors has been extended with two new solutions, which are particularly suitable for museums, art collections,

exhibitions and all applications where light must enhance the quality of the objects being exhibited. By using the latest generation of LEDs, the quality of the light is perfectly matched with energy efficiency. A great deal of research went into finding an LED lamp with a light spectrum

able to enhance warm colours in a similar manner to halogen lamps, but absolutely free of ultraviolet and infrared emissions. The innovative wall washer optic has been designed to homogeneously light walls without areas of shadow in the space close to the ceiling.

sustainability / accent light /
structured / innovation /
retail / display cases

Massimo Iosa Ghini

Pixel Pro was an attempt at shaping dynamism and with the use of new LED technology, the line takes a step forward in defining the future of lighting design. The highly innovative project is the expression of bold research and decisions. It has been designed for applications that require a lighting body with beauty, character and emotion, but at the same time with low energy consumption.

The product integrates with the environment with its fluid and soft silhouette that defines the space with character and elegance. Its design is the result of a careful and thorough reflection of its aesthetic, resulting in the refinement of its details. Without neglecting the versions with conventional sources, Pixel Pro makes an innovative use of LED technology. The heat dissipation is controlled through

the design of the dissipator: the functional element is transformed into an aesthetic object. Pixel Pro is perfect for all situations requiring a flexible and structured lighting system, which can enhance locations and products. The improved chromatic yield heightens the colours of the goods, whilst the lack of UV and IR rays ensures that particularly sensitive objects are not damaged.

- Recessed installation on false ceilings with thicknesses from 1 to 30 mm.
- Manufactured with recyclable materials: aluminium and steel.
- LED versions with warm and neutral monochromatic white emission; available with passive dissipation – with lamellar radiator – or active dissipation – with cooling fan; all models are fitted with an integrated electronic control gear.
- Versions with latest generation discharge lamps with integrated electronic control gear (except for HIT - G12 models); available in versions with high performing optics (ECA compliance).
- Class of insulation II (LED version).
- Class of insulation I (discharge versions).

The quality of a projector is determined by the optical system, the reflectors and the lenses, which must direct the light flow from the lamps correctly. The particular texture of the reflectors must

produce a light distribution without the defects produced by the possible imperfections of the lamps and in particular the typical halo effect of discharge lamps. The lenticular surface

of the reflectors has been carefully studied to produce micro reflections which can eliminate defects, without reducing the optical performance, and therefore the efficiency, of the fittings.

Laser Blade

led / sustainability / energy efficiency
general lighting / anti-glare
small dimensions / concentration
simplicity / retail

LEDs, due to their shape and their nature of dot-like sources of extremely concentrated light, raise two types of issues that require studied solutions. The first is the correct return of the balance of colours and the chromatic quality of the light and the second is anti-glare. In these cases iGuzzini's solutions are called iPlan, for a diffused and relaxed light and Laser Blade, for a more concentrated and, in some ways, "dramatic" light

that eliminates light beams that cross the eyes and which are not required to light the objects. The high efficiency of the fitting is guaranteed due to the utilized lenses which aim the light flow on the desired area. Spillage outside the desired area is minimized by the lenses (cut off) utilized by iGuzzini. One of the primary advantages of using Laser Blade is derived from its minimal dimensions. This quality allows

one to create patterns on the ceiling which was previously impossible with other forms of recessed lighting. The limit, but also the strength of this solution is that it concentrates the light on horizontal surfaces: shelves, tables, floors. It is particularly suitable as an accent light that, silhouetted against darker walls, highlights, by contrast, the objects displayed in the windows and on the shelves.

- Recessed installation in false ceilings with 1-25mm thickness; fixing system with steel wire springs.
- Main body with radiant surface made of die-cast aluminium.
- High-definition optics made of metallised thermoplastic material, integrated in the innovative black anti-glare screen that defines emission with luminance control UGR<19.
- Versions with perimeter frame and flush with ceiling (frameless); single LED or multiple-cell models available.
- The special configuration of the optical system delivers a precise circular distribution without punctiform effect.

Piero Castiglioni

Several years have passed since the last revolution within the lighting industry. It was brought about by the introduction and spread of halogen lamps; both high and low voltage systems. The new lamps, with their extremely wide range of power and their small dimensions have paved the way for designers to come up with new devices and a new concept of lighting design. New technology and the spread of luminous diodes represents a further great revolution which was unthinkable even just a few years ago. LED technology has very quickly reached levels of performance, duration, colour rendering and reliability that allow it to be used in a wide range of applications and to drive industrial research, while simultaneously allowing for the adapting and conversion

of various existing models in the catalogue. The revision of a series of products, amongst which is the Cestello and all its derivatives, have resulted in a light device that incorporates the light source within the body. Additionally, the system offers a choice between two different heat dissipation systems; active and passive. The lamps with active heat dissipation integrate a small cooling fan, which allows the use of LEDs with a total power of 35 Watt and a light emission, which would be impossible with other types of lamps in these devices, thereby increasing performance. The inclusion of a ready-made parts, such as a small cooling fan (systems found in computers) within a lighting device, continues along standing tradition which began in the last century and

was used by artists and designers alike (Duchamp, Man Ray, the Castiglioni brothers, Bruno Munari etc.). The lamps, with passive heat dissipation (without forced ventilation), are characterised by a power of 25 Watt and an emission of 1650 lumens; they can replace traditional halogen and metal halide lamps in areas that require silence. Four innovative optics have been designed for the new lamp: refractors designed with the use of nanotechnology provide spot (16°), average (30°), flood (46°) and elliptical beams. Various beams can be achieved by replacing the glass in front of the source; a further revolution in terms of management and maintenance. This new lamp can be used as a veritable lighting device thus reducing energy consumption, whilst achieving good colour rendering and reliability over time.

led / savings / lighting efficiency
constant chromatic quality
visual comfort / colour rendering
coordinated system
offices / conference halls

Visual ergonomics is directly proportional to the correct return of balance of the colours and the chromatic quality of the light.

The solution designed by iGuzzini with the iPlan and iPlan LED achieves a soft, diffused and glare-free light. iPlan now has a high-performance LED solution in addition to the fluorescent lamp version. In this case the technological innovation of placing the new LEDs on the perimeter

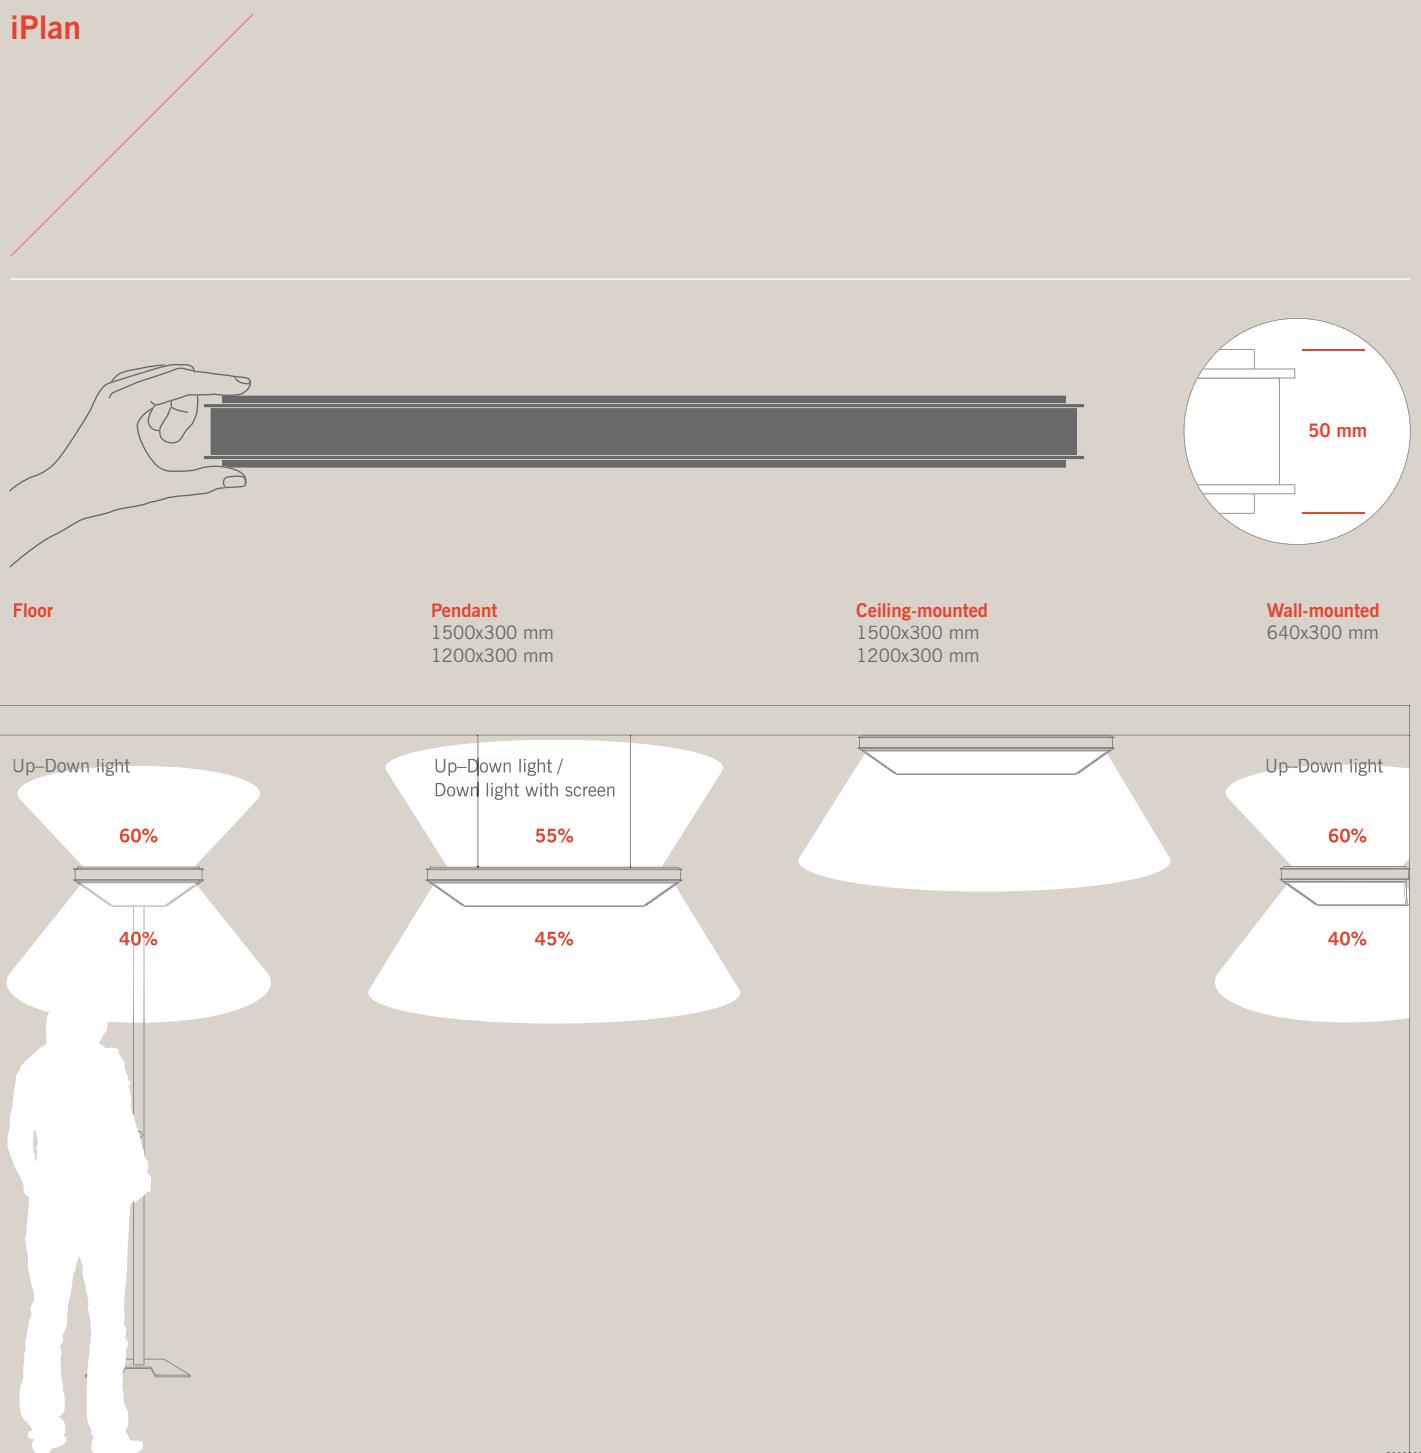

of the lamp body ensures that part of the light produced is directed downwards by the bottom of the fitting. The bottom is covered with a highly-efficient mirror reflector that "mixes" the concentrated light of the LEDs, further softened by the microprisms on the internal surface of the diffusor. This allows for a homogenous and highly efficient light surface with fewer LEDs (for further

savings in energy consumption). Additionally, it reduces the thickness of the luminaire, which can be mounted on the ceiling, recessed or suspended. In order to attain maximum benefit and energy efficiency from the system, it is essential that the fitting be sealed hermetically, in order to prevent dust entering, as this could compromise the optical efficiency of the internal surfaces lit by LEDs.

Optical system

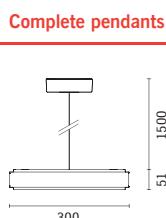

The thinness of the product is obtained
thanks to the positioning of the LEDs
on the perimeter of the lamp body.

- Direct/indirect light emission fluorescent fitting.
- Available in suspended, ceiling mounted, wall-mounted and floor versions.
- Optical assembly with lateral profiles in extruded aluminium; injection molded polycarbonate end caps; steel sheet internal casing cover; methacrylate diffuser screen with microprisms and transreflective film.
- Versions with electronic control gear, DALI and with inverter.
- Floor versions: square section extruded aluminium support rod; steel base with no-skidrubber feet; with 2m long cable with plug; available with electronic control gear with dual start, DALI and DALI ACTILUME. (with motion and lux sensors).

Lightshine

led / energy saving / visual comfort
small dimensions / functionality
simplicity / long life / modularity
offices / conference halls

Bruno Gecchelin

Light has no body, it is not an object. Light is not matter, it is not a “thing”. We see it in lighting, in the sky, or in fireworks invented by man. On the other hand light creates things by illuminating them; it reveals their shape, colour and defines their position in space. With fire man also invented light. And to support it and transport it, he invented torches and then

lanterns, etc. One of the latest light supports, of the over one hundred that I have designed, is Lightshine, a blade that cuts space, that stops where light is required and emits it with grace and abundance. It is a simple aluminium profile, with two gently curved sides that join on two delicate edges. This simple but effective profile allows for rows of LEDs to be placed within,

providing light with high and low contrast. If a space needs to be lit professionally, the light must become the queen of this operation: its costumes must be correct, fitted and suitable for its specific functions as queen of the space. This is even harder when the dress, as in this case, must be produced industrially. But the result is guaranteed: this is iGuzzini haute couture.

iN30 LED

led / energy efficiency /
visual comfort / modularity /
small dimensions / simplicity /
general lighting / offices / retail

The evolution of lighting systems is being guided by the rapid introduction of LEDs, which quickly increased their performance, both in terms of energy efficiency and the quantity of luminous flux emitted. The iN30 system has extended its range of solutions by introducing new LED versions,

which allow setups of lighting solutions that adorn the space with continuous fine lines, but at the same time are proper general lighting solutions. Careful study of the optics allows realization of general lighting levels, normally required indoors, while simultaneously

eliminating glare, especially in working areas that incorporate video monitors. Reduced dimensions, careful control of light distribution, easy installation in continuous lines, and high energy efficiency are the basic features of the new iN30 LED versions.

Control the visual glare according
to legal requirements

- Manufactured in extruded aluminium profile in minimal version (frameless).
- Available in two direct emission versions: low contrast for general light with opal diffuser screen; high contrast with modules for controlled luminance direct light UGR<19.
- Low contrast: ceiling, suspension and recessed installation; modules with two lengths available in initial or intermediate version for continuous line compositions; the initial modules can be completed with the accessory caps and used singularly but they are always necessary to open or close a continuous line.
- High contrast: ceiling and suspension installation; modules with two lengths; possibility of single or combined installation in continuous line, completing the modules with accessories supplied.

LED Street Lighting

Wow

U.F.O.

The underlying theme and credo of iGuzzini's street lighting solutions is environmental sustainability. LED's, with their extremely high performance, represent the future in terms of efficiency, low consumption, reduction of CO₂ emissions and increased performance, even in critical conditions.

As the temperature rises, in fact, the light flow decreases, whilst with LEDs and their electronic components, the ratio between watts and lumens can be optimised by automatically controlling the current required based on the external temperatures, thus avoiding overheating

the lamps and extending their life. LEDs significantly improve the colour rendering index (IRC, that is the ability of a source to maintain the colour of an object it illuminates unaltered), and it has been proven that a light with constant IRC provides better lighting of a road surface and any dangers (holes, animals and obstacles in general), thus improving safety. iGuzzini refers to this innovation not as an "intelligent system", but a system of single "intelligent fittings" that, thanks to the on board electronics, work without wasting energy. Each fitting can be dimmed, to allow

punctual control operations in specific situations, such as, for example, uniform lighting on roads and greater luminescence on roundabouts. Moreover, the body of the lamp is constructed using various independent modules which makes the replacement of LEDs an easy task. They can be removed without complex maintenance operations and without the need to replace the entire pole (providing consequent savings on site costs and convenience). The increased performance allows for new systems, to reduce the number of poles required for adequate lighting.

Wow

led / eco-sustainability / performance
lighting efficiency / low consumption
long life / colour rendering
light pollution / road safety
modularity / reliability
easy maintenance / solidity
Timeless Led technology

Wow is the most innovative solution for street lighting, which achieves maximum light quality, whilst at the same time reducing energy consumption and therefore management costs of the systems. The innovative Timeless Technology ensures that the fitting can be kept up to date by following the fast evolution

of LEDs. In fact the single optical module with LEDs, and the relative driver, can be replaced with a new module that uses the latest generation of LEDs, without having to replace the entire fitting. A solution that allows the single modules, and not the whole fitting, to be replaced quickly if there are any damaged LEDs.

Wow features a street optic for streets with mainly vehicular traffic and an optic for streets with a greater number of pedestrians for increased visual comfort. The research of the shape was based on optimising the technical performance and on achieving a piece of urban furniture with streamlined lines.

U.F.O.

led / energy efficiency /
light pollution / diffused lighting /
visual comfort / easy maintenance /
flexible composition / modularity /
safety / long life / urban lighting /

A comforting light for a living room, an urban living room in order to soften its shadows. This is the primary characteristic of U.F.O., designed by Renzo Piano, which looks almost like a luminous leaf with a homogenous distribution of glare-free light. At the heart of the project is once again the focus on light pollution, resulting in a flow that does not spill over the screen, but is aimed downwards. The efficient, modular luminous panels, which can also be aggregated, increase comfort compared to traditional solutions and can be used in different public areas, creating warm and welcoming atmospheres for town centres, pedestrian and residential areas, and more neutral effects for car parks and rest areas. The flexibility of the solutions starts from the square geometry

of the basic panel, which can be combined with different arms for applications on poles. U.F.O. applies the technology used in the iPlan system, with LEDs positioned along the profile. Cities are increasingly a space in which functions interweave and overlap. Streets bring together both vehicular and pedestrian traffic, each one with its own requirements in terms of light quality. The U.F.O. system was designed with the aim of providing a street lighting system coordinated in terms of form but articulated in terms of lighting. U.F.O. features a high performance street optic for streets with mainly vehicular traffic and an optic for streets with a greater number of pedestrians for increased visual comfort. A diffused light optic, achieved with the innovative use of LEDs, has been designed

for pedestrian areas, which contributes to creating a comfortable environment free of glare, with softened lights, very similar to the effect achieved with indirect lighting.

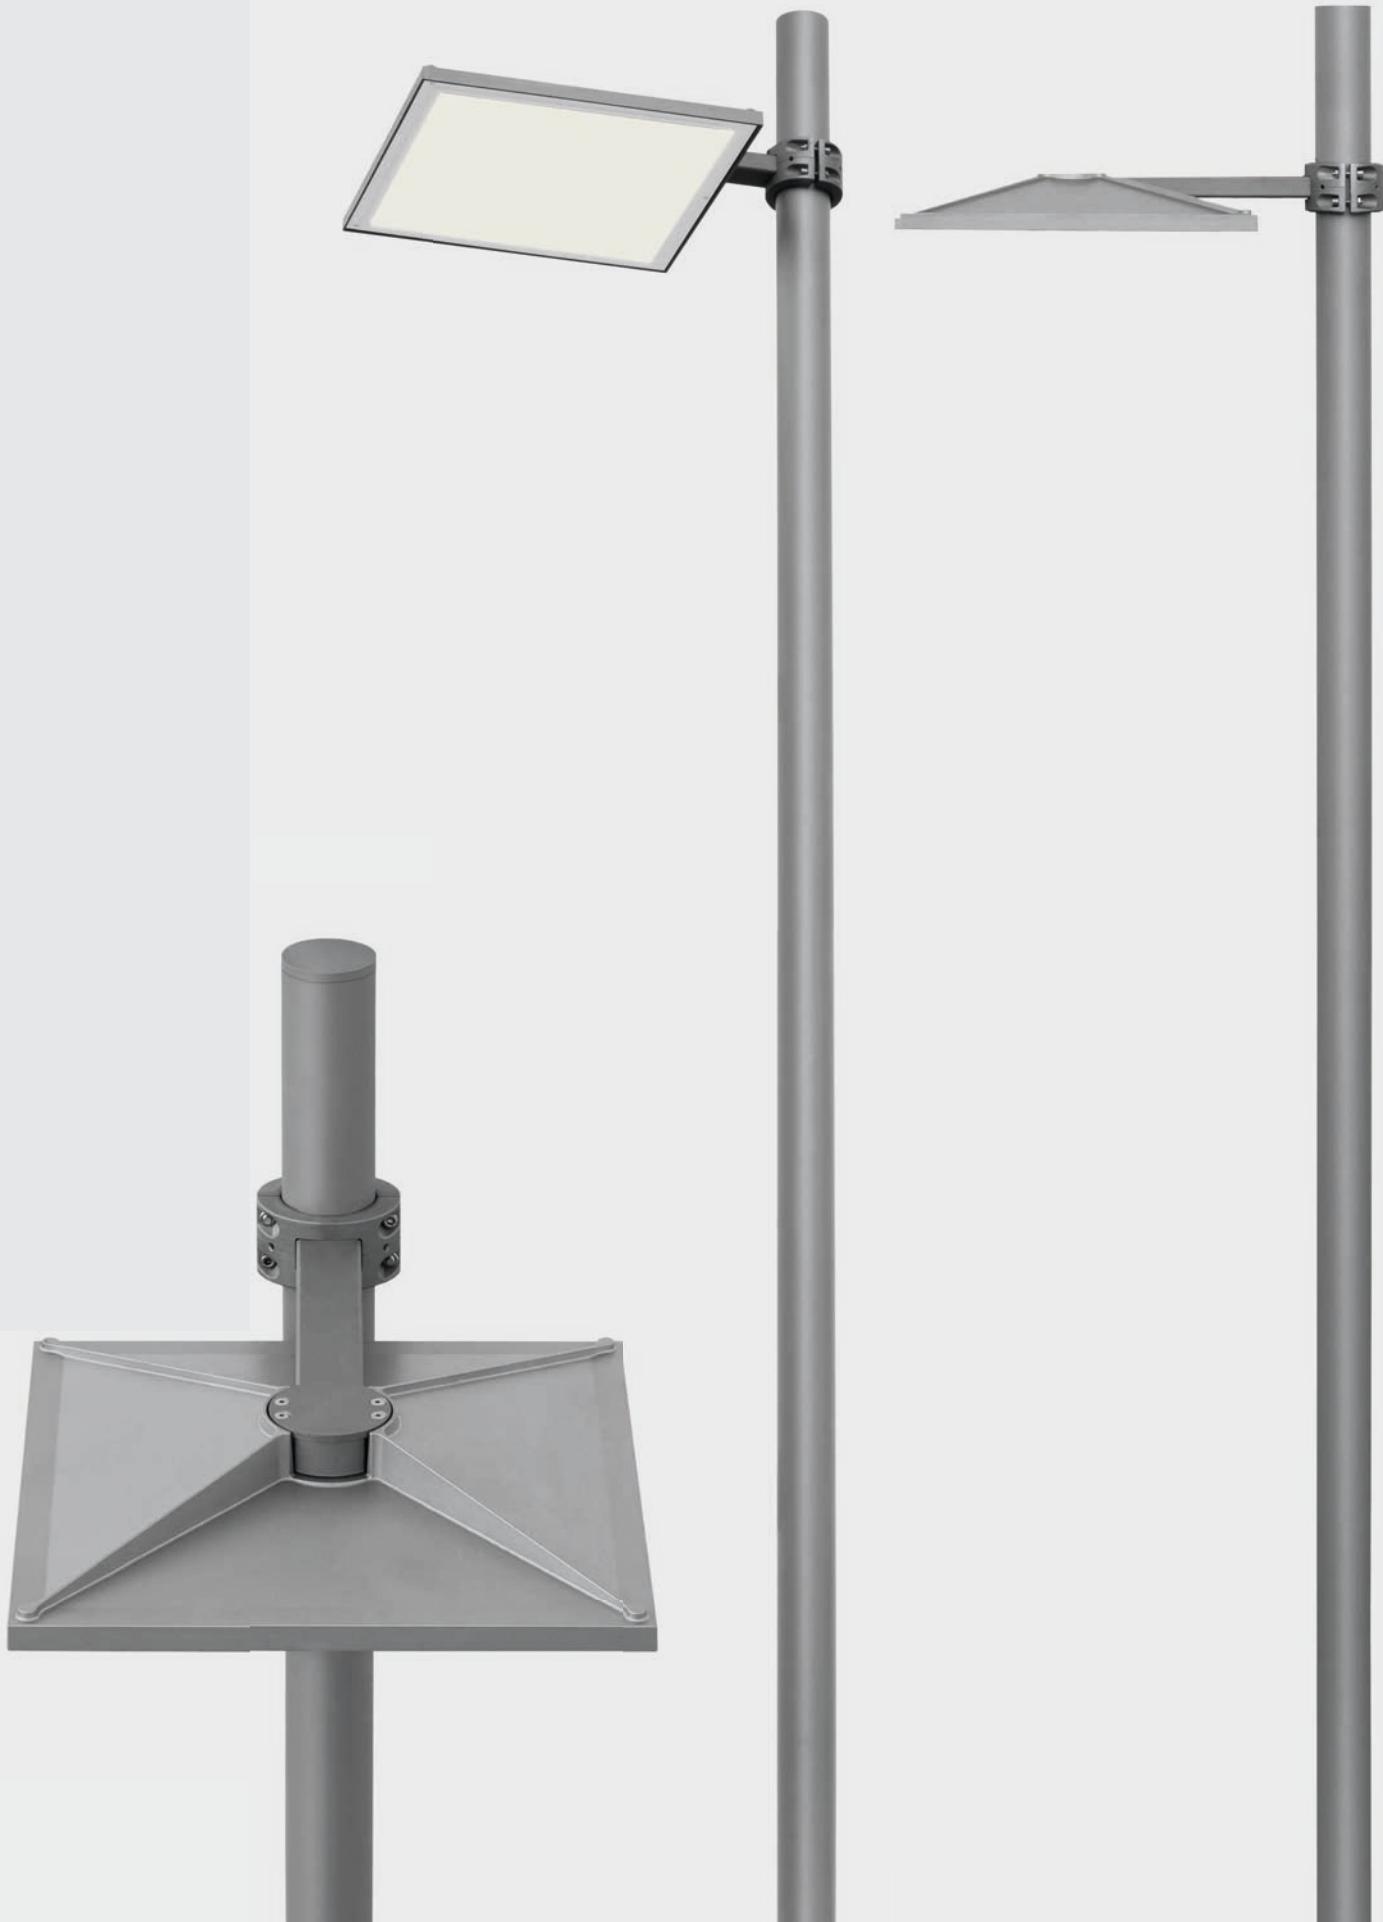

The possibility of fitting various optics on the pole ensures that various requirements can be fulfilled at the same time, such as lighting the street and the adjacent pedestrian way. The design of the system has created an urban furniture system with contemporary lines, that can easily be inserted in any urban context, both historical and contemporary.

System

Diffusing optic

Optical system

The ultra-thin design was achieved with the LED layout along the perimeter of the panel

SC

$I = 3,7\text{h}$
 $d = 1$

— C0 / C180
--- C90 / C270
cd / 1000 lm

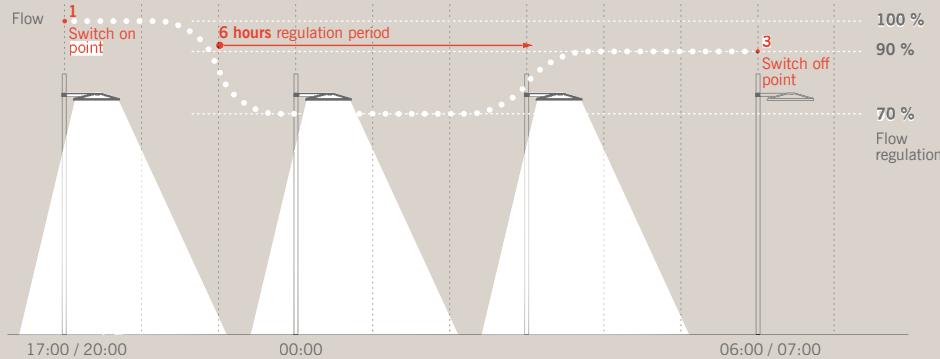

The light flow of the fitting can be wholly programmed directly on the product driver.

As well as the 100% light emission, the midnight recognition function allows for a reduction of the light flow by 30% for 6/8 hours from 22 to 4/6.

The fitting also features a variable power function.

Glare Index: G6

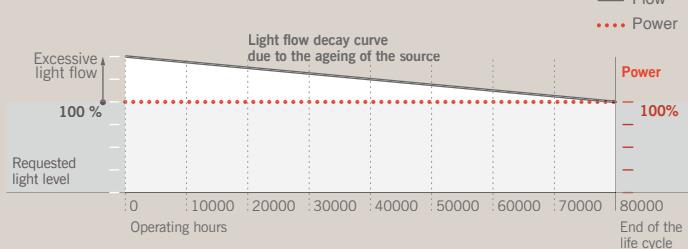

Midnight recognition

example of customised light emission

Fitting at constant power

Fitting operating with constant power and recommended maintenance factor 0.8 to guarantee the minimum lighting value required by the standard at the end of the life cycle

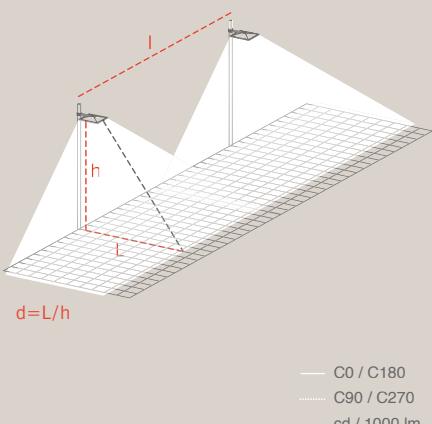

Fitting at variable power

Fitting operating with variable power to maintain the flow constant within the minimum lighting value required by the standard

Maintenance factor	LED power	Lifetime	Efficiency lm/watt	Emitted flux variation compared to 350mA
0,9	350 mA	92000 h ≈ 20 y	108	
	450 mA	66000 h ≈ 20 y	100	+22%
	525 mA	57000 h ≈ 20 y	94	+38%

Patent Pending

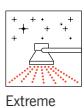

- Direct pole lighting system for LED light sources.
- Lateral installation with arms for ending parts with diameters ø 60/76/89/102/114/120mm.
- Die-cast aluminium optical assembly; sodium-calcium sealing glass, 5 mm thick, or in opaline polycarbonate for versions with SC optic, siliconed to frame that closes the LED compartment with screws.
- Monochromatic LED power versions with reflectors in silver aluminium available with 5 different light distributions
- DALI and 0-10V versions on request.
- All external screws are in stainless steel.

iRoll 65 System

led / energy efficiency /
urban furniture / parks and gardens /

The iRoll system can be applied to poles to become a coordinated feature for urban furniture and public spaces. Thanks to the asymmetrical optics it produces a light distribution which is

particularly suitable for pedestrian walkways and cycle lanes. The operating costs of the system have been reduced with the use of energy saving and long lasting LEDs.

Mario Cucinella

The iPro mini and micro versions are part of a range of products which in its development, from large to small, are suitable for a variety of uses. Originally conceived as a set of simple cubes, inspired by children's toys, the design strives to preserve the geometry of that shape, so

that performance is the distinctive feature. The mini and micro versions are designed to blend in with architectural surfaces so as to reduce the visual impact of the products, which thanks to their basic structure are concealed amid the complexity of the architectural backdrop.

Both products use LED lamps and are designed to be able to be grouped together, both on brackets and on walls. The intention is to use smaller products, in larger numbers, rather than a single luminaire. This allows more freedom in the lighting setup.

Dean Skira

The Lun-Up is an LED recessed application that can be used to light vertical surfaces. In particular, Lun-Up is perfect for being positioned between columns and trees. All the white decorative glasses, or the RGB versions, can be used for sign systems in floors or on walls. Its primary differences to traditional lights are that it is very small, takes up

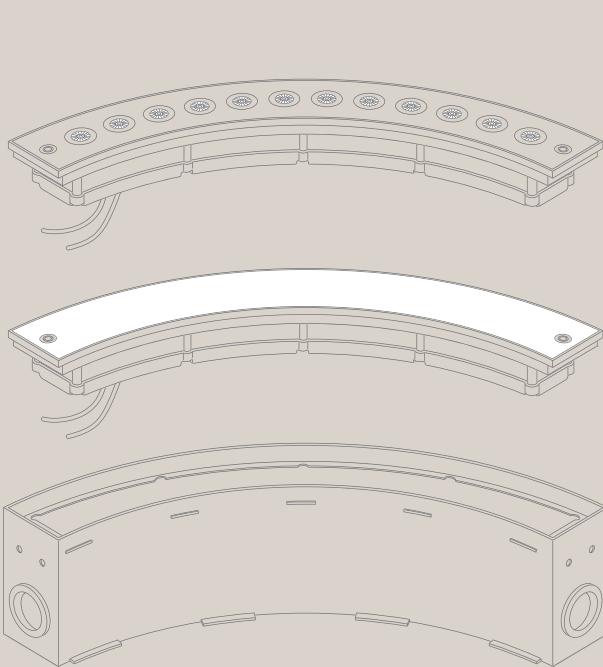

less space and is almost invisible in the daytime landscape. Its shape, a quarter of a circle, allows for the creation of semi-circles, full circles or three quarters of a circle, or more sinuous and free shapes. It is perfect to light any round surface, because its shape easily follows the shape of the object being lit. It does not create surface light streaks; it is a simple

and purely functional lighting tool. Lun-Up can be used in both public and private spaces and its efficiency is not only due to the use of the light source, but also because it requires much less material and energy to be produced. And we are very proud that the Lun-Up has been included in the final selection for the 2012 Lighting Design Award in London.

Led Tube

led // flexibility // modularity
lighting effects // outdoor // indoor

The shape of the architectonic space is defined by levels and lines. Artificial light has, up until now, mainly focused on enhancing the levels. The new LED lamps are not simply a revolution in terms of reducing energy consumption but they allow, for the first time,

a redefinition of the shape of the space with lines of light. Led Tube provides a useful alternative to achieve perfectly straight lines of light, by simplifying the installation both inside furniture, such as shelves, glass cabinets and showcases, but also in

shelves on walls and ceilings. Thanks to the availability of multiple lengths and adjustable arms, the Led Tube is a flexible product that can be used in various architectural contexts. Furthermore, the uniformity of light emitted is a reliable advantage.

Registered Design

- Direct lighting fitting for monochromatic LED light source and signalling RGB.
- Ceiling, wall and ceiling-mount installation.
- Cylindrical body in extruded polycarbonate: end caps and cable clamp supports in die-cast zamak complete with silicone gaskets.
- Secured with stainless steel arms L=60 and L=120mm.
- All external screws are in A2 stainless steel.

Jean Michel Wilmotte

The new generation of Linealuce LEDs is a fusion of light and technology. This product has been designed and developed for architects; a range of lights pared down to their simplest expression. The system has been appreciated for its versatility

and modularity and, thanks to LED technology, it guarantees a considerable level of reliability. The Linealuce ecodesign values can be summed up in the use of durable materials and components, in the reduction of energy consumption through

the use of LEDs and in the ease of disassembly at the end of the product's life cycle. A limited visual impact is guaranteed by its small dimensions. It seems, therefore, an extremely efficient tool to highlight and exalt architectonic spaces.

- Wall and ceiling installation with accessory supports.
- Extruded aluminium body, with die-cast aluminium end caps complete with silicone gaskets.
- Lateral power box in PPS.
- Optical assembly closed on top with a transparent glass screen, 3 mm thick, secured with silicone.

- The lateral box is supplied with double connector, male/female, with 3-pole fast coupling for through wiring and end cap on one side.
- The product is supplied with electronic control gear, contained inside the fitting.
- Dimmable monochromatic and RGB versions complete with electronic power supply + DALI or DMX-RDM internal driver.
- All external screws are in A2 stainless steel.

- Wall and ceiling installation with accessory supports.
- Extruded aluminium body, with die-cast zamak end caps complete with silicone gaskets.
- Optical assembly closed on top with a transparent glass screen, 3 mm thick, secured with silicone.
- The product is supplied with single PG9 cable clamp in nickel-plated brass and PVC exit cable. For the electrical connection a linear connector IP68 and connector block IP67 with fast coupling terminals.
- Electronic control gears to be ordered separately.
- Dimmable and RGB monochromatic versions: Vin=24Vdc electronic power supplies to be ordered separately, Dali or DMX-RDM internal drivers contained in extruded aluminium side box, with aluminium die-cast end caps complete with silicone gaskets, PG13,5 nickel-plated brass cable clamps and outgoing cables.
- All external screws are in A2 stainless steel.

- Floodlight for metal halide light sources.
- Installation on the ground/floor, wall (with plugs and reinforcement bracket) and on pole systems (with flanges and reinforcement bracket).
- Aluminium alloy optical assembly and frame; clear, transparent tempered sodium-calcium sealing glass, secured with captive screws; stainless steel retention cable; silicon gasket 50-60 Shore A.
- Reflector in superpure aluminium. Optics available: SuperSpot (SS) - Spot (S) - Wideflood (WF).
- Lamp holder support plate removable from rear compartment, in hot-dip galvanized steel sheet, complete with ignitor and line disconnecting switch; box and cover in painted aluminium alloy; spacers and captive screws.
- IP65 aluminium power box to be ordered separately, complete with control gear, non explosive power factor correction capacitor and terminal box.
- External screws in stainless steel.

Disclaimer

General conditions

iGuzzini reserves the right to discontinue any products from its collection at any time whatsoever and without prior notice, without prejudice to the essential characteristics of the models described; iGuzzini also reserves the right to make technical and photometric modifications as well as to change any parts, details or finishes deemed suitable for improvement purposes or due to construction and commercial requirements. Goods travel at the customer's risk and peril, even those sold franco domicile.

Any exporting of goods purchased must be authorised in advance and in writing by iGuzzini. The pole + product compositions shown in the catalogue are merely indicative, in particular as concerns the wind-thrust stability test, which should be performed based on both the characteristics of the location and the regulations in force. For installation purposes refer exclusively to the conditions described in the instruction sheet included in the product package and/or on the Web site www.iguzzini.com

The data and information contained in these pages is to be considered indicative and non-binding. iGuzzini reserves the right to cancel, alter, or rectify the data and information for legal and/or technical and/or technological reasons. iGuzzini, in any case, will try to do everything in its power to ensure that all the data and information herein are correct and up-to-date when printed, yet shall not be held accountable if, regardless of various proofreads, there should be inaccuracies and/or errors because of, and not limited to,

legal or technological updates, use of software that is different from that utilized by iGuzzini, and/or issues that are out of Guzzini's control.

For information and updates on compatibility of the light sources with the fittings illustrated in this catalogue, reference must be made to the instructions sheets that can be downloaded from the e-catalogue at www.iguzzini.com

These conditions shall apply from 01.01.2012

Safety seals

In order to guarantee operation and safety, public boards have established specific standards which protect the end user against risks. iGuzzini illuminazione in line with its policy of quality and safety, makes products which comply to these standards. The non-electrified components of the system (such as cover plates, couplings, etc.) cannot be considered as lighting fixtures and therefore are not included in the standards used by the Quality Seal Institutes for their classification. However, all the components of the certified systems have been tested by the said Institutes to ensure compatibility and safety.

The luminaires in the iGuzzini collection are designed in conformance with European standards EN 60598-1 and more specific ones, therefore meeting these requirements in full, including the maximum temperatures allowed and considering the ambient temperature to be 25°C. For those countries or areas where the luminaires are to be installed with thermal and microclimatic references which are different from those foreseen (e.g.: swimming pools, premises subject to the risk of explosion, etc...), we invite you to contact us. For the correct installation of the luminaires, always consult the instruction sheet provided with the product.

Guarantee

iGuzzini warrants that their products are free from any defect in manufacturing and/or material in case of proper use, for a period of five years from the date of the invoice prior to online registration at www.iguzzini.com and acceptance of specific conditions. In any case, iGuzzini recognises the warranty rights foreseen by the law.

Information

For enquiries, remarks and service needs, please contact the reference company for your geographical area (see details in this catalogue).

Notes

- For the ENEC mark of the individual codes, please go to the download area of the on-line catalogue at
- LED life is 50,000 hours for internal products, except for Cestello, Frame and Minimal, Deep Frame and Deep Minimal (30,000 hours)
